

ANGAS, George French. On a new Species of *Pennella*
Ann. Mag. Nat. Hist., vol. 19, p. 280; text fig. 1847.

In Lat. 11, 54 S., Long. 27 W. I found a new and remarkable parasite belonging to the genus *Pennella*, subsisting on the body of a dolphin (*Coryphaena*); it was buried in the fish near the gills as far as the junction of the neck with the abdomen. I am favored with the following description of it by my friend Dr. Baird of the British Museum;

Class CRUSTACEA; Division ENTOMOSTRACA; Legion SIPHONOSTOMA; Order LERNIDA; Family LERNAEOCERIDA; Genus *Pennella*; Species *P. pustulosa* Baird.

Head rounded and furnished with small fleshy projections of a light red color. Two fleshy prolongations at its base, short and obtuse, terminating at the tip in a small red knob. Neck long and slender, and as well as the head transparent, showing the intestine and red blood. Abdomen of a very dark purple color, and studded all over with small whitish pustules. Plumose appendages simple. Ovipigerous tubes very long and slender. Length 4 inches.

ANGAS, G. F. *Savage Life and Scenes in Australia*, Vol. I, p. 31.

For figure see species card.
